

Harismruti App — Status Report

Server migration to 103.177.181.215:9000 — testing summary

Date	July 15, 2026
Change	Base API URL switched from hpsmruti.suhrad.digital to 103.177.181.215:9000
Tested on	iOS Simulator (iPhone 16 Pro) and physical iPhone device

1. What's Working

- App connects successfully to the new server (103.177.181.215:9000) over the mobile API.
- App boots and renders the UI correctly on both simulator and a real iPhone.
- Home feed, Recent Photos, and Collections endpoints return real data — server has 3,501 photos indexed.
- People/Groups listing works correctly.
- Login and session token persist correctly between app restarts.
- App installs and runs on a physical iPhone via wireless debugging.

2. App Bugs Found & Fixed — already resolved

#	Issue	Root Cause	Fix
1	App showed a blank white screen on every launch	An unhandled error in the push-notification setup step (no APNS token available) stopped the app before the UI ever loaded.	Wrapped notification setup in error handling so the app continues loading even if push setup fails.
2	“People” section failed with a server error (422)	App was sending an invalid sort option (sort=latest); server only accepts count or name.	Changed the default sort value sent by the app.
3	“Recent Smruti” home section showed “No smruti found” despite the server having photos	App's response parser expected a plain list of photos, but the new server wraps results in a paged object. The parser silently returned an empty list.	Updated the parser to unwrap paginated responses correctly.
4	My Favorites and My Collections looked broken on-device — heart icon turned red / photo saved, but it never showed up in My Favorites or My Collections	The app picks a photo's date to decide which era tab (Prabodh / Hariprasad) it belongs to. When the real photo date field was missing, it fell back to the server's import timestamp (today's date) instead of the photo's actual date — so old photos got misclassified into the wrong era tab and filtered out of view.	Fixed the date fallback to use the photo's real date fields before falling back to the import timestamp. Confirmed working on a real device after the fix.
5	My Diary entries saved under the wrong date — writing an entry for today showed up dated one day earlier	The app sent the entry's date as a full timestamp with no timezone marker. The server correctly converted it to UTC for storage, but the app read the date back without converting it back to local time first, so the calendar date shifted back a day.	Fixed the app to send a plain date (no time/timezone) and to correctly convert timestamps back to local time when reading dates. Confirmed working on a real device after the fix.
6	App crashed immediately on launch on a real iPhone running iOS 26 (worked fine on the simulator)	The app's push-notification entitlement was left enabled even though this test build's signing account doesn't actually support push notifications. That mismatch triggered a low-level crash in Apple's push framework right after launch, on real devices only.	Removed the push-notification entitlement for this build. App now launches cleanly on a real iPhone with no crash.

Status: All six issues above are fixed in the app code.

3. Additional Feature Testing

Feature	Result	Notes
My Favorites	Working	Confirmed on a real device after the date-fallback fix (see bug #4 above) — heart icon saves and shows correctly in My Favorites.
My Collections	Working	Confirmed on a real device after the date-fallback fix (see bug #4 above) — saves and shows correctly in My Collections.
My Diary	Working	Confirmed on a real device after the date fix (see bug #5 above) — entries now save and display under the correct date.
Filters / attribute search	Working	Returns full filter lists (location, subject, album, country, etc). Empty only on the Prabodh tab, same known cause as Recent Smruti — this server has no Prabodh-era photos.
My Smruti selfie upload	Working	Uploaded a test selfie — server accepted it and returned a pending-review image record correctly.

Note: test data created during this pass (1 favorite, 1 collection named “Test Collection”, 1 pending selfie review) — safe to remove.

4. Security Finding — Backend Configuration

- The selfie-upload response includes an “authenticated_url” with an unconfigured placeholder API key (api_key=CHANGE-ME-IN-DOTENV-OPENSSL-RAND-HEX-32) instead of a real key. This means the server's environment configuration still has a default/template value in production — should be set to a real secret.

5. Known Limitation — expected, not a bug

- Push notifications are disabled on this test build (see bug #6 above — this is what was causing the real-device crash). Apple blocks the Push Notifications capability on free/personal developer accounts; once the app is signed with a proper paid Apple Developer account for release, the entitlement can be re-added and push notifications will work normally.

6. Not Yet Tested

- Notification campaigns / topics — requires triggering from the backend admin panel, can't be tested from the app alone.

7. Recommended Next Steps

- **App:** no action needed right now — all issues found in this pass have been fixed.

Generated during a testing session on the Harismruti app codebase.
